M-delta-1 polypeptide (AAW11720) is the mouse homologue of Drosophila Delta, a protein that binds to Notch protein. It is expressed primarily in presomitic mesoderm, the central and peripheral nervous systems, and kidney. Chick (AAW11719) and human (AAW11721-38) Delta-1 polypeptides have also been identified. Delta-1 proteins can be used to treat or prevent disorders characterised by increased Notch activity, such as cervical, breast, lung or colon cancer, melanoma or seminoma, as well as nervous system disorders, and to promote tissue regeneration and repair

The invention relates to modulating the differentiation of an embryonic catem cell, comprising: (a) providing a culture of embryonic stem cells; (c) by providing at least one ligand or its active binding fragment, capable of binding at least one ligand or its active binding fragment, capable of binding at least one ligand or least seed to be binding at least one ligand or least seed to be binding at least one ligand, and (d) forming a culture comprising embryonic stem cells and the ligand, and (d) growing the cell culture. Also included are: (i) any of 9 fully defined with a nucleic acid molecule selected from: (i) any of 9 fully defined with a nucleic acid molecule selected from: (i) any of 9 fully defined with a nucleic acid molecule which are dependented as a result of the genetic code to code any of a ligand capable of binding a whr receptor; or (iii) mucleic defined which are degenerated as a result of the genetic code to the sequences of (i) or (ii) (b) forming a culture comprising the cell deferentiation of the embryonic stem collure for the maintenance and/or differentiation of the embryonic stem cells; (a) providing at the differentiation of the embryonic stem cell; and (c) growing the cell identified in (a) with an embryonic stem cells, comprising the cell identified in (a) with an embryonic stem cells; and (c) growing the cell identified in (a) with an embryonic stem cells, comprising; (a) providing a cell transfected with a nucleic acid molecule selected from: (i) a molecule encodes a polypeptide capable of inhibiting the differentiation of embryonic stem cells; on the and molecule selected from: (i) and encodes a polypeptide capable of inhibiting who signalling; on (ii) nucleic acid molecule selected from: (i) becaming a culture contained state, and (ii) nucleic acid molecule selected from: (i) becaming a cell transference of embryonic stem cells; comprising the cell identified in (a) with an embryonic stem cells; on undifferentiated state, and (ii) or (ii); hording a providing a cell comprising ad
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Huntington's disease, motor neuron disease, heart disease, diabetes, liver disease (e.g. cirrhosis), renal disease and AlDS (acquired immunodeficiency syndrome). The present sequence is represents a Wnt Notch pathway protein (i.e. a ligand for the method of the invention)
                                                                                                                                                                                                                                                                                                                                                                                                                    Modulating the differentiation of embryonic stem cells by providing ligands which bind receptors in the Notch and Wnt pathways, useful ftreating diseases such as Parkinson's, Huntington's, heart disease,
                                                                                                                                                                                                                                                                                                            <u>.</u>

The present invention relates to a novel screening method which enables the identification of biologically active agents which mediate their the identification of biologically active agents which mediate their effect through the activation of genes. The method involves providing a population of cells stably transfected with a nucleic acid encoding a reporter molecule, cloning the transfected with a nucleic acid encoding a reporter molecule, cloning the transfected cells into a cell array, crossing the array to at least one agent to be tested and detecting a signal generated by the reporter molecule as a result of exposure to the gent. The method is useful in identifying biologically active agents and the genes through which the agents act, in screening potential drugs for their ability to activate certain drug targets in a high-throughput assay, in identifying relationships between signalling pathways and specific signals that could be useful in eventually directing the could be useful in eventually directing the testing for unwanted activation or inhibition of genetic signalling pathways. The present sequence is murine notch ligand delta-like I protein used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DLGNSYLCRCQAGFSGRYCEDNVDDCASSPCANGGTCRDSVNDFSCTCPPGYTGKNCSAP 480

cc mucleic acid or its antibody, the activity or levels of delta protein is modulated and vice versa. A delta cleavage poptide or its derivative capable of binding kuz protein is useful for treating or preventing a disease or disorder associated with increased delta activity or expression such as cervical, breast, colon or lung cancer, melanoma or eseminoma in humans. A recombinant cell comprising a delta peptide is useful for treating or preventing central nervous system disorders. A cleavage peptide is useful for the diagnosis of diseases or disorders associated with increased levels of Notch-delta protein binding activity comprising measuring the ability of delta cleavage peptides in a cativity comprising measuring the ability of delta protein and kuz is useful complex, complex or screening for the presence of, or predisposition to developing a disease or disorder associated with aberrant levels of the complex, comprising measuring the level or functional activity of the complex or RNA encoding delta or kuz in a sample. The delta cleavage peptide is also useful for promoting tissue regeneration and repair, for treating liver cirrhosis, keloid formation, psoriasis, baldness and degenerative or traumatic disorders of the sensory epithelium of the

```

This sequence represents the murine delta protein amino acid sequence. Delta is a toporythmic protein that contains a sequence which is cleaved by the metalloprotease-disintigin Kuzbanian (Kuz). Cleavage by Kuz results in two fragments, a soluble amino terminal fragment consisting cessentially of the extracellular domain, and a membrane bound fragment consisting of the transmembrane domain and the intracellular domain. The soluble fragment is able to bind to Notch. Delta plays a key role in differentiation, and therefore detection and measurement of delta activation is important in the study of differentiation. The invention relates to the delta cleavage peptides (the active fragment), and to methods for detecting and measuring delta activation. Delta cleavage peptides, and chimeric proteins are useful for modulating the activity of Notch, delta or kuz or at least one of the signalling pathways in a cell or organism, expressing Notch. By contacting a cell with kuz protein or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a polypeptide which suppresses proliferation and differentiation of undifferentiated cells such as neurons and blood cells. The polypeptide may be used for the prevention and control of disorders involving undifferentiated cells, such as leukaemia and malignant tumours, and improvement of blood formation, e.g. after immunosuppression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide(s) encoded by human genes delta-1 and serrate-1 - suppress proliferation and differentiation of undifferentiated human blood cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         718
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          719
                                                               This sequence represents the human delta-1 protein, which is a ligand of the human notch protein. The protein or fragments, especially AAW75493-W75495, can be used as a drug to control vascular cells. The sequences were isolated and the truncated fragments were generated using the primers AAX16818-X16831
                                                                                                                                                                                              9
                 Vascular cell controlling agent comprises polypeptide - which is human notch ligand and is used as drug.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    KDVSVSIIGATQIKNTNKKADFHGDHGAEKSSFKVRYPTVDYNLVRDLKGDEATVRDTHS

The present invention describes full length and shortened human delta-2 proteins. Human delta-2 is a differentiation inhibitor which inhibits the differentiation of undifferentiated cells (other than brain or muscle cells), such as blood cells, and enhances the proliferation of undifferentiated blood cells. Products of human delta-2 may be used for the treatment of diseases such as leukaemia and malignant tumours. They may also be used in the culture of human cells in vitro, e.g. for production of supplies of undifferentiated blood cells. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and disgnosing immune related disorders are useful for treating and disgnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Siogran's systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases, inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune of diseases and transplantation associated diseases including graft rejection and graft-versus-host-disease. Ancessis the lung, and transplantation associated diseases including craft rejection and graft-versus-host-disease. Ancessis the sequences and Mybridisation probes used in the isolation of human PRO sequences. AACSSS79 to AACSSS78 represent PRO primers and Mybridisation probes used in the isolation of exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus.

Isolated PRO211, PRO228, PRO518, PRO172 or PRO182 polypeptides or their agonists (preferably anti-PRO agonist antibody or a small molecule mimicking the biological activity of PRO polypeptide) are useful in vitro or inhibiting the growth of a tumour cell. Compositions comprising the PRO polypeptides are useful for inhibiting neoplastic sgrowth and for treating cancer including breast, ovarian, renal, renal, colorectal, uterine, prostate, lung, bladder, central nervous system cancer, melanoma and leukaemia in a mammal. The PRO polypeptides are also useful for treating other disorders such as neuronal, gilal, astrocytal, blastoccelic disorders and inflammatory, angiogenic and immunologic disorders as well as being useful for identifying agonists to PRO disorders and inflammatory, angiogenic and immunologic disorders as well as being useful for identifying agonists to PRO monitoring biological activity mediated by the polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           119

ANUL2172-AAU12446 represent novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bioactrive molecules to cells expressing PRO polypeptides, to modulate biological activities of cells expressing PRO presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation or gene expression in pericyte cells, the release of protecoglycans from cartilage, the proliferation of inner ear utricular supporting cells or of T-lymphocytes, the proliferation of endothelial cells or of T-lymphocytes, the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide to factor villa. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polymclectides encoding PRO polypeptides can be used to generate PRO antisecence of the probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated , secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumors e.g. lung,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gao
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Filvaroff E, Ga

The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AABS3064-B53097), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins compraining a PRO protein, expression of a PRO protein, and compounds which inhibit the expression of a PRO gene. The invention additionally encompasses methods of identifying modulators of PRO carpitals or angiogenic disorder, or a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO source of a protein, or PRO agonist or antagonist; a retroviral gene therapy vector comprising a PRO nucleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antagonist thereof. PRO mucleic acids, PRO protein, or an agonist or antagonist thereof. PRO agonist cands who proteins, antibodies against PRO proteins, PRO andiched and proteins, PRO cardiovascular or antagonist thereof. PRO agonist cands applied to a magonist can antagonist the protein and agonist cands and proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cardiovascular, endochelial or anajogenic disorders, such as atheroscients, endochelial or anajogenic disorders, such as atherosciencesis, osteoporosis, myocardial infarction, hypertension, diabetic retinopathy, rheumatoid arthritis, Crohn's disease, psoriasis, endometriosis, ulcers, wounds, cancer, Alzheimer's disease, Huntington's disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, as hybridiation probes to screen libraries to isolate cobns with sequence identity to PRO proteins, to map genes encoding PRO proteins, to analyse genetic disorders, and in gene useful for the development and screening of potential therapeutic agents. The present sequence represents a PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid for producing a PRO polypeptide, analyzing genetic disorders and treating cardiovascular, endothelial or anglogenic disorders, such as atherosclerosis, wounds or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Goddard A;

The invention describes an isolated nucleic acid (I) comprising, or which has 80 % sequence identity to, or the full-length coding sequence of, one of 275 nucleotide sequences, and which encodes a corresponding codypeptide selected from 275 amino acid sequences, where all sequences are given in the specification. The polypeptide encoded by (I) is used to detect PRO polypeptides, link a bioactive molecule to a cell expressing a CR propolypeptide, modulate a biological activity of a cell, stimulate the telease of tumour necrosis factor (TNF)-alpha from human blood, modulate the proliferation or differentiation of cells, stimulate cor inhibit the proliferation or differentiation of cells, stimulate cor inhibit constituents are stimulate the release of proteoglycans, stimulate the release of cytokine stimulate the release of proteoglycans, stimulate the release of cytokine constituents are sequenced to tumour in a mammal. The nucleic coff and polypeptide encoded by it, are useful for treating inflammatory diseases, organ failure, atheroscletosis, cardiac injury, infertility, brith defects, premature aging, acquired immunodeficiency syndrome condisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as harmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. This is the amino acid sequence of a novel human secreted and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New secreted and transmembrane PRO nucleic acids, for treating infilammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, axquired immunodeficiency syndrome (AIDS), or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gao
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Deforge L, Desnoyers L, Filvaroff E, G:

Gao

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO useful in the treatment of diabetes, bone and/or cartilage disorders (e.g. rheumatoid arthritis, sports injuries, osteoarthritis), obesity, hyper- or hypo-insulinaemia, hearing loss, and coagulation disorders (e.g. stroke, heart attack). Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, issues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. ABUS0870-ABUS1144 represent the human PRO polypeptides of the invention. Note: The sequence data for this patent sequata.uspto.gov/psipsDDEntry.html

Sequence 723 AA;
